Time Petri Nets: Theory, Tools and Applications

Part III

Louchka Popova-Zeugmann

Humboldt-Universität zu Berlin Department of Computer Science Unter den Linden 6, 10099 Berlin, Germany

ATPN 2008, Xi'an, China

Louchka Popova-Zeugmann (HU-Berlin)

Time Petri nets, Part III

< ∃ >

Outline

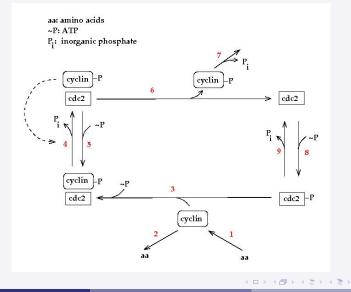

Louchka Popova-Zeugmann (HU-Berlin)

<ロ> < 四> < 回> < 回> < 回>

Application

The relationship between cyclin and cdc2 in the cell cycle

Louchka Popova-Zeugmann (HU-Berlin)

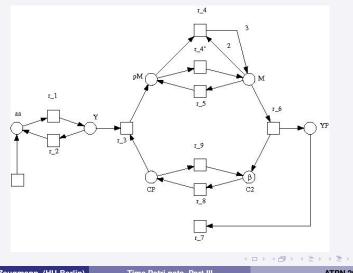

Time Petri nets, Part III

< E ► E ∽ Q C ATPN 2008 3/21

Application

The relationship between cyclin and cdc2 in the cell cycle as a DIPN

A PN model of the continuous system:

ATPN 2008 4/21

Louchka Popova-Zeugmann (HU-Berlin)

Time Petri nets, Part III

• A PN model of the system (a biochemical network) should be bounded and live in the time.

• A PN model of the system (a biochemical network) should be bounded and live in the time.

• For each reaction a minimal and maximal rate is given (described with a differential equation)

• A PN model of the system (a biochemical network) should be bounded and live in the time.

- For each reaction a minimal and maximal rate is given (described with a differential equation)
- The outcome of this is a minimal and a maximal duration for each reaction

• A PN model of the system (a biochemical network) should be bounded and live in the time.

- For each reaction a minimal and maximal rate is given (described with a differential equation)
- The outcome of this is a minimal and a maximal duration for each reaction

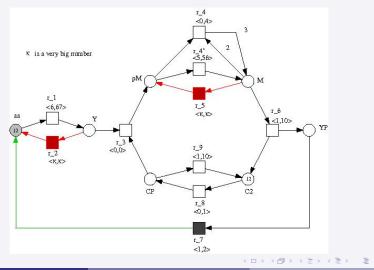

• The time dependent model of the system is a **DIPN** (**Duration Interval Peiri Net**)

Application

The relationship between cyclin and cdc2 in the cell cycle as a DIPN

A DIPN model as a momentary snapshot of the continuous system:

Louchka Popova-Zeugmann (HU-Berlin)

Time Petri nets, Part III

The DIPN model is **bounded** and **live**, because:

< ∃ >

The DIPN model is **bounded** and **live**, because:

• The skeleton is bounded; Proved with INA

The DIPN model is **bounded** and **live**, because:

- The skeleton is bounded; Proved with INA
- The TPN, derived by the translation of the DIPN is live; Proved with INA

The DIPN model is **bounded** and **live**, because:

- The skeleton is bounded; Proved with INA
- The TPN, derived by the translation of the DIPN is live; Proved with INA

And:

• The minimal time distance between the initial state and an arbirary state in which k_4 is ready to fire is 74; Proved with INA

Thus, the minimal time for starting the dephosphorylation of the cdc2 in order to form active MPF modelled with k_4 is not less than 74 minutes.

Petri net input file > tyson-without-time.pnt

:

Information on elementary structural properties:

The tyson-without-time PN is:

The net is not statically conflict-free. The net is pure. The net is not ordinary. The net is not conservative. The net is not subconservative The net is not a state machine The net is not free choice. The net is not extended free choice. The net is not extended simple. The net is not safe. The net is not live and safe. The net is marked The net is not marked with exactly one token. The net is not a marked graph. The net is not homogenous. The net has not a non-blocking multiplicity. The net has no nonempty clean trap. The net has no transitions without pre-place. The net has no transitions without post-place. The net has no places without pre-transition. The net has no places without post-transition. The net is connected The net is strongly connected.

Louchka Popova-Zeugmann (HU-Berlin)

< ロ > < 同 > < 回 > < 回

Further Properties

- o DTP: deadlock-trap-property
- o SMC: state machine coverable
- o SMD: state machine decomposable
- o SMA: state machine allocatable
- o CPI: covered by place invariants
- o CTI: covered by transition invariants
- o B : bounded
- o SB : structurally bounded
- o REV: reversible
- o DSt: dead state reachable
- o BSt: bad state reachable
- o DTr: dead transition at initial marking
- o DCF: dynamically conflict free
- o L : live
- o LV : live when ignoring dead transitions
- o L&S: live and safe
- o Liveness for coloured nets
- o WL : weakly live
- o CL : collectively live

Appendix

The relationship between cyclin and cdc2 in the cell cycle

In step 1, cyclin is synthesized *de novo*. Newly synthesized cyclin may be unstable (step 2). Cyclin combines with cdc2-P (step 3) to form pre-maturation promoting factor (preMPF). At some point after heterodimer formation, the cyclin subunit is phosphorylated. ... The cdc2 subunit is then dephosphorylated (step 4) to form active MPF. In principle, the activation of MPF may be opposed by protein kinase (step 5). Assuming that active MPF enhances the catalytic activity of the phosphatase, I arrange that MPF activation is switched on in an autocatalytic fashion. Nuclear division is triggered when a sufficient quantity of MPF has been activated, but concurrently active MPF is destroyed by step 6. Breakdown of the MPF complex releases phosphorylated cyclin, which is subject to rapid proteolysis (step 7). Finally, the cdc2 subunit is phosphorylated (step 8, possibly reversed by step 9), and the cycle repeats itself.

(Tyson, J., *"Modeling the cell division cycle: cdc2 and cyclin interactions"*, Prod.Nat.Acad.Sci. USA,Vol. 88, 1991)
