# Example

- We are given a list of donors
- What is the probability of someone being a donor at the age above 50?  
 $p(\text{Donor}|\text{Age}>50)$
- What is the probability of someone being a donor at the age above 50 and with >50k salary?  
 $p(\text{Donor}|\text{Age}>50, \text{Salary} > 50k)$

Name	Age	Salary	Donor?
Nancy	21	37k	N
Jim	27	41k	N
Allen	43	61k	Y
Jane	38	55k	N
Steve	44	30k	N
Peter	51	56k	Y
Sayani	53	70k	Y
Lata	56	74k	Y
Mary	59	25k	N
Vitor	61	68k	Y
Dale	63	51k	Y

# Bayes Theorem

- Bayes' theorem for conditional probabilities:

$$p(c|f_1, \dots, f_n) = \frac{p(f_1, \dots, f_n|c) \cdot p(c)}{p(f_1, \dots, f_n)} \propto p(f_1, \dots, f_n|c) \cdot p(c)$$

is proportional to

constant wrt. the class c

- The **a-priori probability**  $p(f)$  of every feature f
  - How many entries from T have f?
- The **a-priori probability**  $p(c)$  of every class  $c \in \mathcal{C}$ 
  - How many entries in T are of class c?
- The **conditional probabilities**  $p(f|c)$  for feature f being true in class c
  - Proportion of entries in c with feature f among all entries in c

# Naïve Bayes

- For some feature combinations  $f_1, \dots, f_n$  there may not be a single instance
- “Naïve”: thus, we assume **statistical independence**:

$$\begin{aligned} p(c|f_1, \dots, f_n) & \\ & \propto p(f_1, \dots, f_n|c) \cdot p(c) \\ & \propto p(f_1|c) \cdot \dots \cdot p(f_n|c) \cdot p(c) \\ & \propto p(c) \cdot \prod_{i=1}^n p(f_i|c) \end{aligned}$$

- **Naïve Bayes Classification**:
  - pick the class  $c$  with the maximum conditional probability  $p(c|f_1, \dots, f_n)$

# Example

$$p(\text{Donor} | \text{Age} > 50) \propto p(\text{Age} > 50 | \text{Donor}) \cdot p(\text{Donor})$$

Name	Age	Salary	Donor?
Nancy	21	37k	N
Jim	27	41k	N
Allen	43	61k	Y
Jane	38	55k	N
Steve	44	30k	N
Peter	51	56k	Y
Sayani	53	70k	Y
Lata	56	74k	Y
Mary	59	25k	N
Vitor	61	68k	Y
Dale	63	51k	Y

$$P(\text{Donor}) = \frac{6}{11}$$

$$P(\text{Age} > 50 | \text{Donor}) = \frac{5}{6}$$

$$P(\text{Donor} | \text{Age} > 50)$$

$$\propto \frac{6}{11} \cdot \frac{5}{6} = \frac{5}{11}$$

$$P(\neg \text{Donor} | \text{Age} > 50)$$

$$\propto \frac{5}{11} \cdot \frac{1}{5} = \frac{1}{11}$$

# Example

$$p(\text{Donor} | \text{Age} > 50, \text{Salary} > 50k) \propto \dots ?$$

Name	Age	Salary	Donor?
Nancy	21	37k	N
Jim	27	41k	N
Allen	43	61k	Y
Jane	38	55k	N
Steve	44	30k	N
Peter	51	56k	Y
Sayani	53	70k	Y
Lata	56	74k	Y
Mary	59	25k	N
Vitor	61	68k	Y
Dale	63	51k	Y

$$P(\text{Donor}) = \frac{6}{11}$$

$$P(\text{Age} > 50 | \text{Donor}) = \frac{5}{6}$$

$$P(\text{Salary} > 50k | \text{Donor}) = \frac{6}{6}$$

$$P(\text{Donor} | A > 50, S > 50k)$$

$$\propto \frac{6}{11} \cdot 1 \cdot \frac{5}{6} = \frac{5}{11}$$

$$P(\neg \text{Donor} | A > 50, S > 50k)$$

$$\propto \frac{5}{11} \cdot \frac{1}{5} \cdot \frac{1}{5} = \frac{1}{55}$$

# (Conditional) Probabilities in SQL

- $p(x)$ :

```
SELECT x, count(*) / sum(count(*) over ()) as percent  
FROM table  
GROUP BY x
```

- $p(x|c)$ : ...?
