## 5. Conclusion

- Data Preprocessing (NDVI)
- **WEASEL Feature Selection/Transformation to Bag-of-Words**
- Logistic Regression/SVM... Classifier

- Fast Fourier Transformation (FFT)
- F-Test for discriminative Fourier coefficients
- Binning with Information Gain (Bag-of-Words)
- Chi-Square for Dimensionality Reduction

# WEASEL

## Fast Fourier Transformation (FFT)

- Input: Preprocessed Time Series NDVI
- Output: Fourier Coefficients

Figure: Example Time Series: 16 time steps

# WEASEL

## F-Test for discriminative Fourier coefficients

- Choose the  $f$  most discriminative Fourier coefficients
- $f$  is the word length
- Example for  $f = 1$  and one Fourier coefficient:

sample	class0	class1
0	0	2
1	3	5

- Choose the  $f$  most discriminative Fourier coefficients
- $f$  is the word length
- Example for  $f = 1$  and one Fourier coefficient:

sample	class0	class1
0	0	2
1	3	5
mean	1.5	3.5

- Total mean: 2.5

# WEASEL

## F-Test for discriminative Fourier coefficients

Figure: Plot of sample data: real0 (left), real1 (right)

$$F = \frac{\text{MSB}}{\text{MSW}}$$

$$\text{MSB}_1 = (1.5 - 2.5)^2 + (3.5 - 2.5)^2 = 1$$

$$\text{MSW}_1 = (0 - 1.5)^2 + (3 - 1.5)^2 + (2 - 3.5)^2 + (5 - 3.5)^2 = 4.5$$

$$F_1 = \frac{1}{4.5} = 0.\bar{2}$$

$$\text{MSB}_2 = (0.5 - 2.5)^2 + (4.5 - 2.5)^2 = 8$$

$$\text{MSW}_2 = (0 - 0.5)^2 + (1 - 0.5)^2 + (4 - 4.5)^2 + (5 - 4.5)^2 = 1$$

$$F_2 = \frac{8}{1} = 8$$

- Get the  $s$  most optimal split points for symbols
- $s$  is the amount of the symbol alphabet
- $Y_i$  : class labels

$$Ent(Y) = \sum_{(s_i, y_i) \in Y} -p_{y_i} \log_2 p_{y_i}$$

$$Ent(Y, x) = \frac{|Y_{Left}|}{|Y|} \cdot Ent(Y_{Left}) + \frac{|Y_{Right}|}{|Y|} \cdot Ent(Y_{Right})$$

$$InformationGain = Ent(Y) - Ent(Y, x)$$

# WEASEL

## Binning with Information Gain

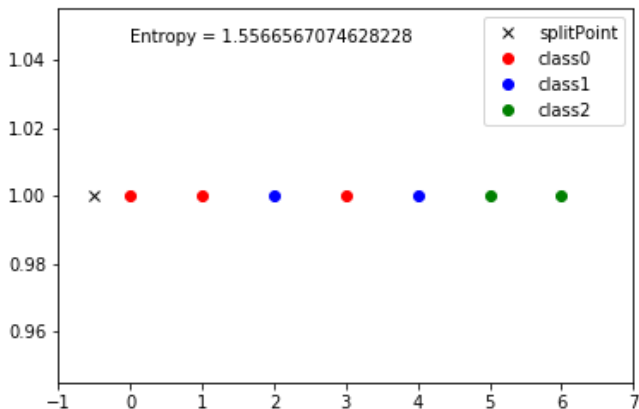

Figure: Fourier Coefficient real1: Find one split point,  $s = 2$

Figure: Fourier Coefficient real1: Max. Information Gain/Min. Entropy

# WEASEL

## Binning with Information Gain

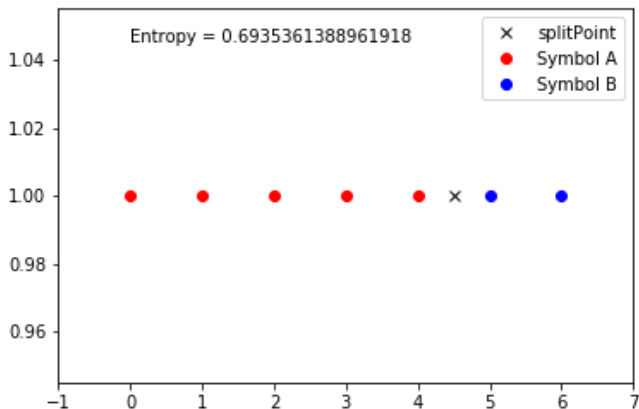

Figure: Fourier Coefficient real1: Splitting point into symbols 'A' & 'B'

- Dimensionality of Feature Space
- $\mathcal{O}(c^l)$  amount of words
- $c$  is amount of symbols,  $l$  is word length
- using bigrams and  $\mathcal{O}(n \cdot \log(n))$  non-overlapping windows yields  $\rightarrow \mathcal{O}(c^{2l} \cdot n \cdot \log(n))$  features

# WEASEL

## Chi-Square for Dimensionality Reduction

	AA	AB	BA	BB	
1	350	50	50	0	450
2	150	50	50	50	300
3	100	0	0	100	200
4	0	0	0	50	50
	600	100	100	200	1000

Table: absolute frequency of words and classes

- degrees of freedom =  $(4 - 1) \cdot (4 - 1) = 9$

- $\chi^2$  values for:

- AA:

$$(80/270)^2 + (30/180)^2 + (20/120)^2 + (30/30)^2 < 2$$

- AB and BA:

$$(5/45)^2 + (20/30)^2 + (20/20)^2 + (5/5)^2 > 2$$

- BB:

$$(90/90)^2 + (10/60)^2 + (60/40)^2 + (40/10)^2 > 19$$

## 5. Conclusion

# Conclusion

- general method for time series classification
- few code adjustments
- lots of hyperparameters
- good scalability
- optimization: majority vote of multiple models (Ensemble)
